## Product Information Sheet

### Razer-Lag™ FRAS Grade Pulley Lagging

#### Function

To transfer the maximum drive energy from the conveyor drive to the conveyor belt without slippage.

- > To shed water on drive and non-drive pulleys.
- > To prevent wear on steel pulley shells.
- > To reduce the incidences of material build up on pulley shells which cause belt damage and poor belt tracking.
- > To prevent aquaplaning of belts.

#### Advantages

- > Razer Industries is 100% Australian owned and operated.
- > Meets all the demands of FRAS grade rubber for below ground and confined mining operations.
- > Provided in 250mm wide strips with an 82mm-repeating pattern for cost-effective installation and pattern matching. This pattern is much quieter in service and suffers less section "Pull-Out" under high torque loading.
- > Superior water shedding performance from the Arrowhead Pattern over conventional diamond and herringbone patterns. Water is shed at the belt/pulley interface.
- > Precision moulded and press cured ensures consistent dimensional and physical properties. Thickness is typically better than  $\pm 0.25\text{mm}$  ensuring high tolerances are maintained against T.I.R requirements.
- > Is supplied pre buffed on the bonding face and edges.

#### Applications

- > On all pulley shells where shell life, water dispersion and/or material build up is a concern.
- > For substantially higher drive friction factors and increased service life in contaminated conditions please refer to our Ceramic Pulley Lagging Information.
